The Computer I Want to Screen Share with is Not Visible

This article explains the steps to make visible a computer you want to remote into and screen share with.

Making a Computer Visible for Screen Sharing

1. Open up a Finder window and select Go from the tool bar at the top of the desktop.
2. Select Connect to Server.
3. Under "Server Address;" put the IP address of the Mac that you need to control in the format "vnc://IPaddress". The IP address for a Mac you are trying to connect to can be found on the "Network" Preference Pane in System Preferences, the VNC address is located under the "Sharing" Preference Pane.

   ! Note
   If you are going to be using Screen Sharing often, click the "+" key to add the IP address to your favorites.

4. Select Connect. You will be prompted to validate your credentials with a username and password or by requesting permission. If you decide to request permission, it will have to be granted with the other Mac. (This is a one-time process. Once you have been granted or grant access the computer will no longer need permission)
5. Once you have been granted access, the screen sharing window will pop up. To disconnect simply close out of the window.
